

hw01

1 Create a variable

Create a variable named `x` that contains the value 1.

```
var: x
```

2 Order of operations

(Book of R, 2.1.b)

Which of the following squares negative 4 and adds 2 to the result? Identify the correct answer and then save the result in a variable called `q2`.

- $(-4)^{2+2}$
- -4^{2+2}
- $(-4)^{(2+2)}$
- $-4^{(2+2)}$

```
var: q2
```

3 Do some math

(Book of R, 2.2)

3.1 *Part 1*

Create an object that stores the value $3^2 \times 4^{1/8}$

```
vars: q3.1
```

3.2 *Part 2*

Create a new object by dividing the answer from Part 1 by 2.33. Print the result to the console.

vars: q3.2

3.3 *Part 3*

Note: you can use scientific notation using the letter e. For example, 4×10^{-6} can be written as `4e-6`

Create a new object with the value -8.2×10^{-13} . Use scientific notation.

vars: q3.3

3.4 *Part 4*

Create a object with the result of multiplying the answers of Part 2 and Part 3.

vars: q3.4

4 Load some data (working directory practice)

Run the following code:

```
df <- read.csv("data/penguins.csv")
head(df)
```

You'll need to make sure your working directory is set correctly in order for this to run.

vars: df
